

Security Audit

Service At The Speed Of Life.

Computer security, security vulnerabilities, and threats are a concern not only to information technology professionals, but also to anyone who uses a computer. Most companies live with "always on" connections to the Internet – connections that expose them to the inherent risks of viruses, hackers and denial of service attacks.

Attacks from viruses like "Code Red" and "Nimda" are on the rise, and proving incredibly destructive to business productivity around the globe. Maintaining the security of systems connected to the Internet is a concern fundamental to doing business in the digital age. Security is one of the most important issues that companies face today.

Let us conduct a security assessment that will show the system's security posture with respect to specific vulnerabilities. The assessment closely examines the network architecture. This includes an assessment of the Internet connection and internal network including network devices, servers, workstations, services, protocols and operating systems using an industry-standard checklist which will help you identify key potential security breaches.
